

Python's Data Science Stack

Jake VanderPlas @jakevdp
JSM, July 31, 2016

Python is *not* a statistical computing language!

**Python is *not* a statistical
computing language!**

**. . . and this may be its
greatest strength as a
language for statistical
computing.**

A Quick Tour of Python's Data Science Stack

Python's Data Science Stack

IP[y]:
IPython

NumPy

Cython

python™

NumPy = Numerical Python

Efficient array storage, manipulation, and computation

NumPy

IP[y]:

NumPy = Numerical Python

Efficient array storage, manipulation, and computation

```
In [1]: import numpy as np
```

```
# Create a 5x5 uniform random matrix
```

```
M = np.random.rand(5, 5)
```

```
# Compute the SVD
```

```
U, S, VT = np.linalg.svd(M)
```

```
print(S)
```

```
[ 2.46102945  0.94542853  0.53550015  0.20705388  0.13071452]
```

NumPy

IP[y]:
IPython

python™

IP[y]:
IPython

Cython = C + Python

Super-set of the Python language that allows easy interfacing with C & Fortran libraries (e.g. BLAS, LAPACK, etc.) and also fast Python code.

Drives many of the packages in the data science stack.

IP[y]:
IPython

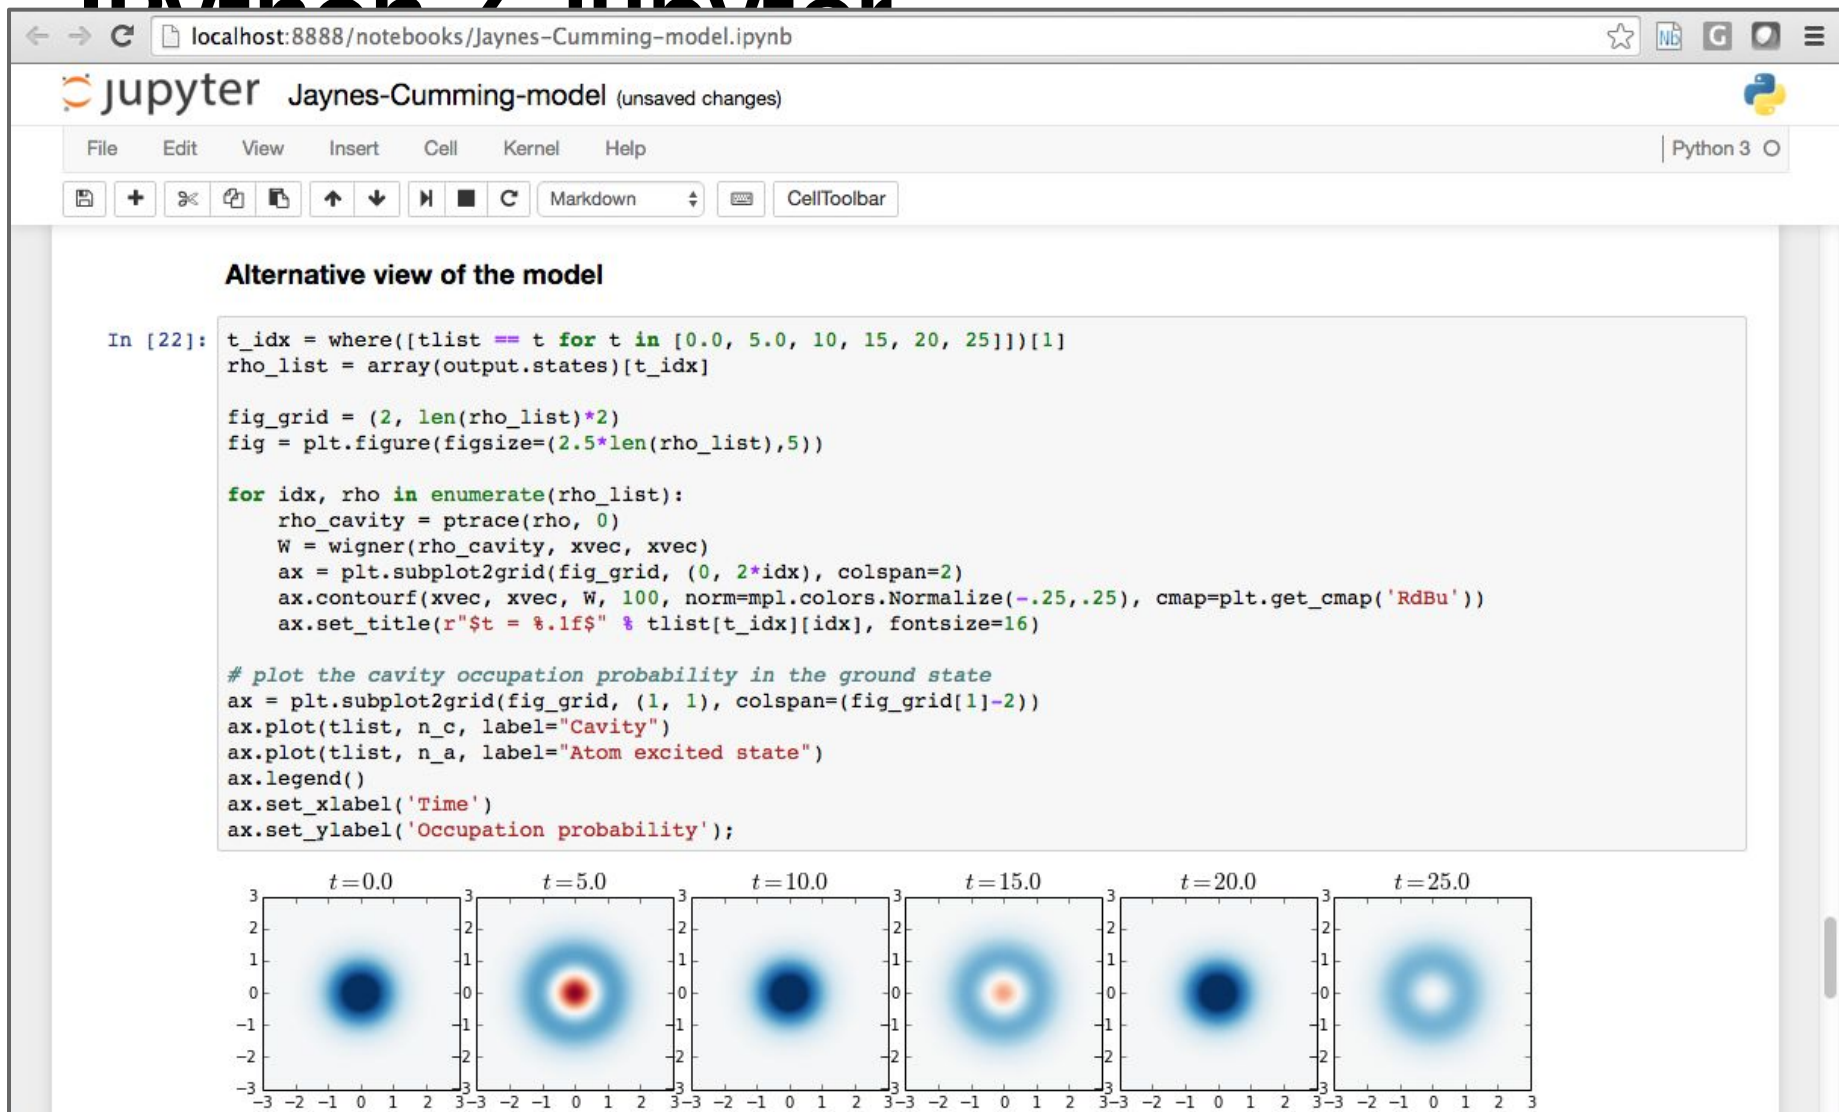

IPython / Jupyter

Terminal, development environment, Notebooks, and more for efficient use of Python in day-to-day work

IPython / Jupyter

IPython

python™

IP[y]:
IPython

NumPy

Cython

pythonTM

pandas

$$y_{it} = \beta' x_{it} + \mu_i + \epsilon_{it}$$

NumPy

SymPy

Recent-ish Developments

- **Dask**: Parallelization of Data & Computation
- **Numba**: LLVM compilation of Python code
- **Jupyter Lab**: interactive & extensible polyglot development environment
- **Altair**: Declarative Visualization based on Vega-Lite

Dask: Parallel Computation for Distributed Arrays & DataFrames

With minimal changes to your NumPy & Pandas expressions, parallelize your computations over distributed data!

Dask: Parallel Computation for Distributed Arrays & DataFrames

A straightforward NumPy computation:

```
In [3]: import numpy as np

# create an array of normally-distributed random numbers
a = np.random.randn(1000)

# multiply this array by a factor
b = a * 4

# find the minimum value
b_min = b.min()
print(b_min)

-11.4051061336
```

Dask: Parallel Computation for Distributed Arrays & DataFrames

Dask uses the same expressions ...

```
In [4]: import dask.array as da

# create a dask array from the above array
a2 = da.from_array(a, chunks=200)

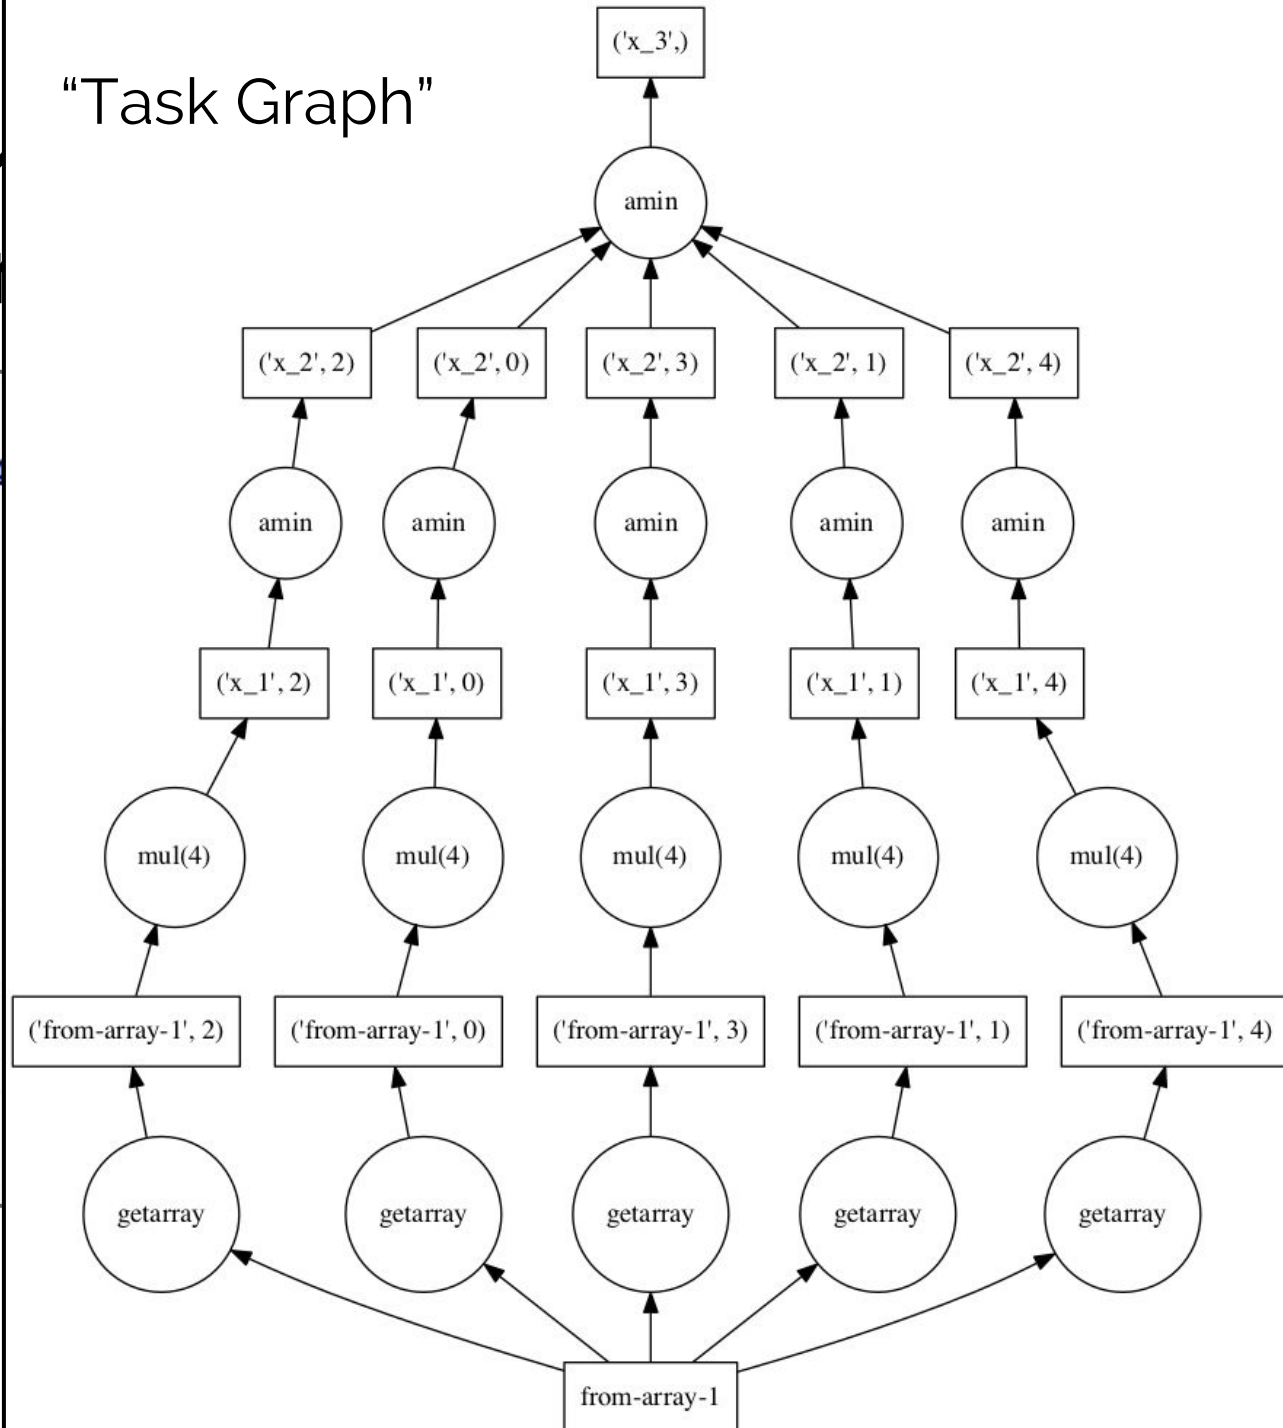

# multiply this array by a factor
b2 = a2 * 4

# find the minimum value
b2_min = b2.min()
print(b2_min)

dask.array<x_3, shape=(), chunks=(), dtype=float64>
```

Task Graph

"Task Graph"

Dask: Parallel Computation for Distributed Arrays & DataFrames

```
In [6]: b2_min.compute()
```

```
Out[6]: -11.405106133564583
```

Numba: JIT-compilation of Python code

With a simple decorator, Python is compiled to LLVM and executes at near C/Fortran speed!

```
def fib(n):  
    a, b = 0, 1  
    for i in range(n):  
        a, b = b, a + b  
    return a
```

```
%timeit fib(50)
```

```
100000 loops, best of 3: 3.83 µs per loop
```

Still some features missing, but very promising (see my blog posts for some examples).

<http://numba.pydata.org/>

Numba: JIT-compilation of Python code

With a simple decorator, Python is compiled to LLVM and executes at near C/Fortran speed!

```
@numba.jit
def fib(n):
    a, b = 0, 1
    for i in range(n):
        a, b = b, a + b
    return a

%timeit(fib(50))
```

1 loops, best of 3: 468 ns per loop

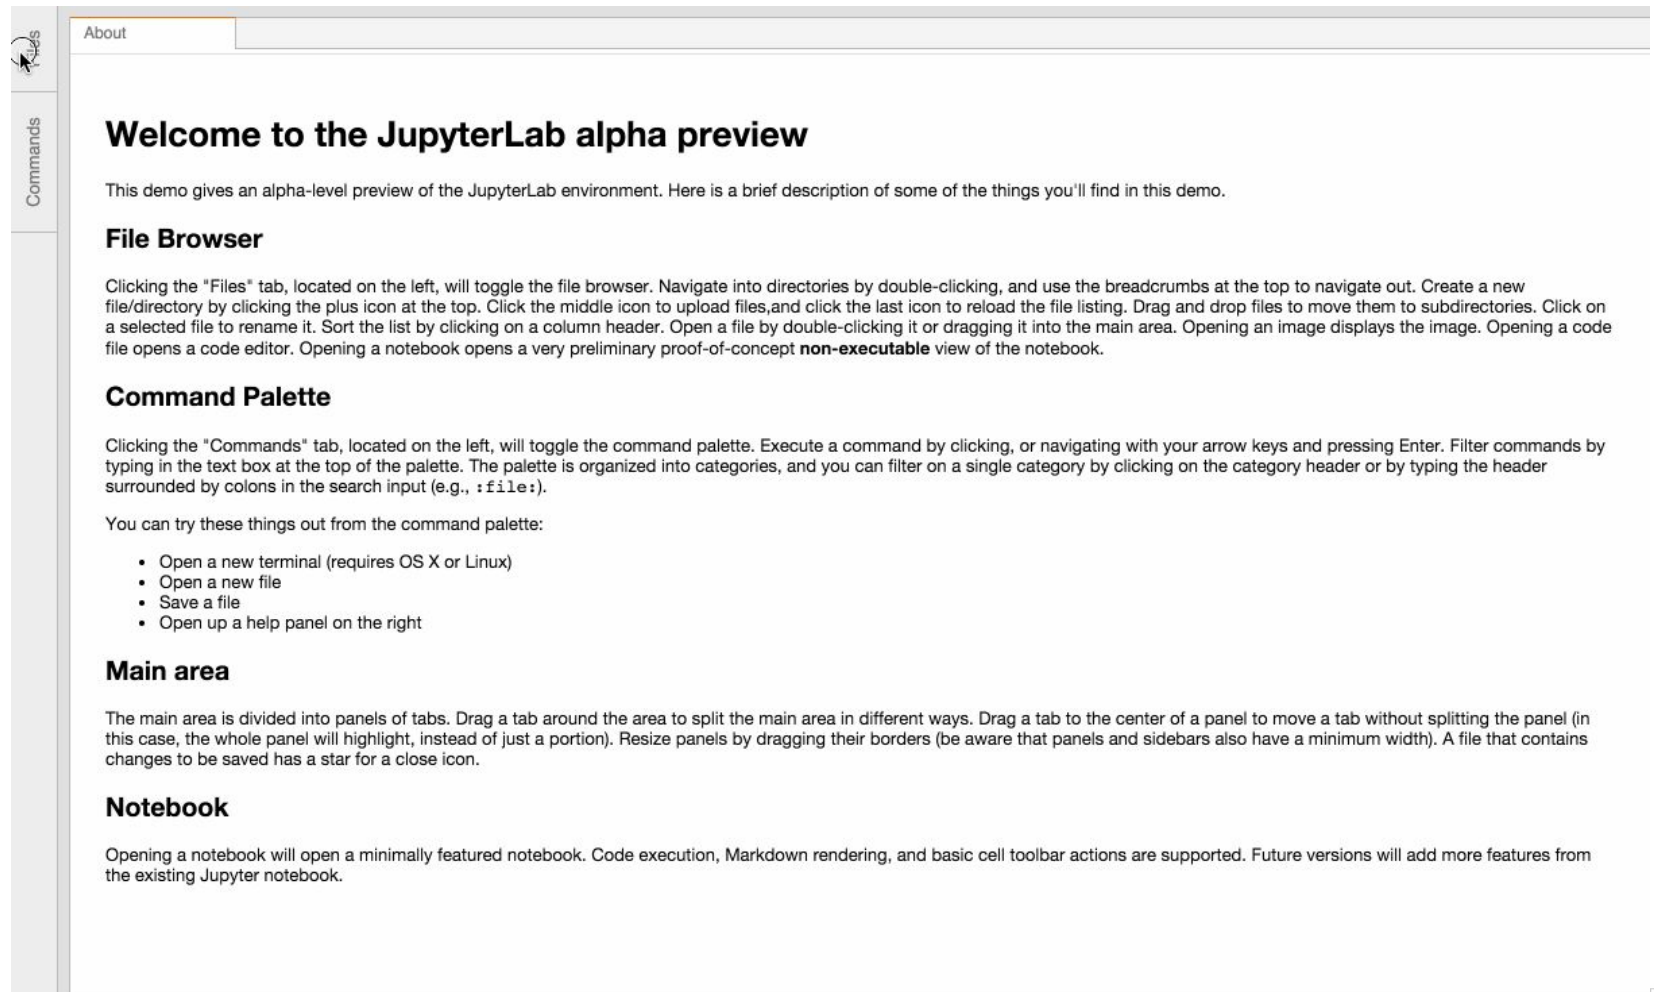

20x speedup!

Still some features missing, but very promising (see my blog posts for some examples).

<http://numba.pydata.org/>

Jupyter Lab

Jupyter beyond notebooks: extensible cross-platform interactive computing environment (release soon!)

Altair: Declarative Visualization based on Vega-Lite

The Visualization story in Python is somewhat confusing . . .

- Matplotlib
- Bokeh
- Plotly
- Seaborn
- Holoviews
- VisPy
- ggplot
- pandas plot
- Lightning

Each library has strengths, but arguably none is yet the “killer viz app” for Data Science.

Most Useful for Data Science is *Declarative Visualization*

Imperative

- Specify *How* something should be done.
- Must manually specify plotting steps
- Specification & Execution intertwined.

Declarative

- Specify *What* should be done
- Details determined automatically
- Separates Specification from Execution

Declarative visualization lets you think about **data** and **relationships**, rather than incidental details.

Enter Altair.

Declarative statistical visualization library for Python,
driven by Vega-Lite

<http://github.com/ellisonbg/altair>

Collaboration with Brian Granger (Jupyter team), myself,
and University of Washington's Interactive Data Lab

UNIVERSITY of WASHINGTON
eScience Institute

#JSM2016

Example: Cars Dataset

```
In [1]: from altair import Chart, load_dataset  
data = load_dataset('cars')
```

```
In [2]: data.head()
```

Out[2]:

	Acceleration	Cylinders	Displacement	Horsepower	Miles_per_Gallon	Name	Origin
0	12.0	8	307.0	130.0	18.0	chevrolet chevelle malibu	USA
1	11.5	8	350.0	165.0	15.0	buick skylark 320	USA
2	11.0	8	318.0	150.0	18.0	plymouth satellite	USA
3	12.0	8	304.0	150.0	16.0	amc rebel sst	USA
4	10.5	8	302.0	140.0	17.0	ford torino	USA

Matplotlib is an *imperative* API:

```
In [4]: import matplotlib.pyplot as plt

def scatter(group):
    plt.plot(group['Horsepower'],
             group['Miles_per_Gallon'],
             'o', label=group.name)

data.groupby('Origin').apply(scatter)
plt.legend(title='Origin')
plt.xlabel('Horsepower')
plt.ylabel('Miles_per_Gallon');
```

Altair is a *declarative* API:

```
In [5]: from altair import datasets, Chart

Chart(data).mark_circle().encode(
    x='Horsepower',
    y='Miles_per_Gallon',
    color='Origin',
)
```

~ ♪

UNIVERSITY of WASHINGTON

Altair is a *declarative* API:

Altair itself contains no renderers, but simply outputs a Vega-Lite visualization specification:

```
from altair.vegalite.v3 import Chart, FacetedChart, Chart

Chart(data).mark_circle().encode(
    x='Horsepower',
    y='Miles_per_Gallon',
    color='Origin',
)
```

```
In [11]: chart.to_dict(data=False)
```

```
Out[11]: {'encoding': {'color': {'field': 'Origin', 'type': 'nominal'},
                        'x': {'field': 'Horsepower', 'type': 'quantitative'},
                        'y': {'field': 'Miles_per_Gallon', 'type': 'quantitative'}},
          'mark': 'circle'}
```

- Portable JSON serialization (Vega-Lite spec)
- Interest from other viz libraries (matplotlib, Bokeh, Plotly) in supporting this serialization.
- Potential for cross-language compatibility

~ ♪

UNIVERSITY of WASHINGTON

Vega-Lite schema is well-defined; allows round-trip between spec and code:

```
In [15]: code = Chart.from_dict(spec).to_altair(data='data')  
print(code)
```

```
Chart(data).mark_circle().encode(  
    color='Origin:N',  
    x='Horsepower:Q',  
    y='Miles_per_Gallon:Q',  
)
```

```
In [16]: eval(code)
```

Altair/Vega-Lite supports many plot types:

```
In [4]: Chart(cars).mark_point().encode(  
    x='Weight_in_lbs',  
    y='Acceleration',  
    color='Cylinders:N'  
)
```

Altair/Vega-Lite supports many plot types:

```
In [6]: Chart(cars).mark_point().encode(  
    x='Displacement',  
    y='Weight_in_lbs',  
    color='Horsepower',  
    row='Origin'  
)  
.configure_cell(width=300, height=150)
```

Altair/Vega-Lite supports many plot types:

```
In [7]: Chart(cars).mark_bar(stacked='normalize').encode(  
    Y('Origin'),  
    X('*:Q', aggregate='count', sort='descending'),  
    Color('Cylinders:N')  
)
```

Altair/Vega-Lite supports many plot types:

```
In [8]: Chart(cars).mark_bar().encode(  
    X('Miles_per_Gallon', bin=Bin(maxbins=20)),  
    Y('*:Q', aggregate='count'),  
    Color('Origin')  
).configure_cell(height=150)
```

Altair/Vega-Lite supports many plot types:

```
In [9]: Chart(cars).mark_text(applyColorToBackground=True).encode(  
    Row('Origin:O'),  
    Column('Cylinders:O'),  
    Color('mean(Miles_per_Gallon):Q', sort='descending'),  
    Text('mean(Miles_per_Gallon):Q')  
)
```

Altair/Vega-Lite supports many plot types:

```
In [10]: Chart(cars).mark_line().encode(  
    X('Year:T', timeUnit='year'),  
    Y('Miles_per_Gallon:Q', aggregate='mean'),  
    Color('Origin:N')  
).configure_cell(height=150)
```

Try Altair:

```
$ conda install altair --channel conda-forge
```

or

```
$ pip install altair  
$ jupyter nbextension install --sys-prefix --py vega
```

For a Jupyter notebook tutorial, type

```
import altair  
altair.tutorial()
```
